BL-10 - Classes, sections and enrollment (#10)

Scope

- Admin creates and views class/section pairs using the existing `Section` model.
- Section names are validated for duplicates (including differences in letter case).
- Admin adds active students to subject-specific section rosters through `TeachingAssignment`.

Server-side form queryset restriction prevents cross-section assignment tampering.

- A student cannot join two sections for the same subject; the error names their existing section.

The existing `(student, subject)` database unique constraint protects concurrent changes.

- Admin may remove an enrollment. Historical attendance records are deliberately not deleted.
- The existing BL-05 `sections.manage` permission enforces server-side Admin-only changes.
- Existing inactive enrollments remain visible with an Inactive label for historical context,

but inactive students cannot be newly enrolled through this workflow.

Dependencies

Apply this implementation after BL-07. Subject creation and faculty teaching assignments belong to BL-09 and BL-11, respectively. Until those screens are delivered, section rosters can be tested with seeded subject and assignment records; they are not created by BL-10.

Verification

```
python manage.py test apps.academics.test_section_enrollment
```

Then `python manage.py test`, `python manage.py makemigrations --check --dry-run`, `ruff check .` and `ruff format --check .`.
